

REGULARISED MARCHING TETRAHEDRA

// ISOSURFACE EXTRACTION

Procedural environment generation for videogames sometimes demands a more advanced implementation than simple heightmaps, in the form of unique topologies. The creation of such environments presents unique challenges, in that the resulting mesh must be watertight and highly regular without human supervision, while at the same time being computationally cheap to generate. This paper compares several approaches to extracting isosurfaces as triangle meshes, and examines requirements and opportunities for further development of mesh generation algorithms specialised to suit this use case. - *ABSTRACT*

"79.53% reduction in triangle count"
"1.16 mean triangle aspect ratio, with SD of 0.15"
